Wireframes in HTML

individual assignment

goal

Redo your PowerPoint wireframe designs in HTML. This will begin the process of developing your prototypes.

exercises

Using the HTML skills you have developed so far, recode your individual wireframe design using HTML with each screen being an HTML page and each button using the <a> tag to link between screens. Use very simple CSS styling so that this is a wireframe not a full-color mockup of your prototype. You can use :hover :active and special class names to make clickable things reactive without much coding.
